

Cyber Resilience Assessment

The Challenges

Recent global events have caused widespread business transformation, forcing organizations to adapt to new ways of working in an extremely short period of time.

A greater level of remote and agile working is now the new normal, bringing with it a host of challenges and threats; phishing attacks alone are up 600%. It's now vital that you take stock of your new risk and security posture, learn lessons from enforced remote working and implement a plan to assure your organization's new position is moving forwards.

The Solution

SureCloud provides technology-based cybersecurity and risk services, and has developed a solution that delivers value in 3 areas:

- **Response Analysis:** Learn lessons from your imposed move to remote working by participating in security clinics that review sample incidents and issues, with your migration to home working;
- **Recovery Planning:** Assess your new security and risk posture, undertake a phishing simulation, and evaluate the effectiveness of current cybersecurity controls to mitigate against data loss and data breaches; and
- **Future Strategy:** Develop a clear plan to stabilize and secure your business in the “new normal”, considering new and emerging threats.

Benefits

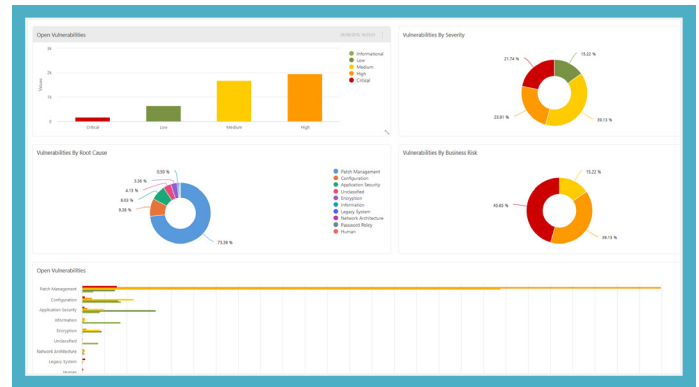

The Cyber Resilience Assessment allows you to:

- Learn from your incident response approach, review and test remote working controls, and remedy identified gaps and weaknesses;
- Review policies to ensure their efficacy for remote working, and understand your organization's readiness to combat phishing attacks, data loss, and other cyber threats; and
- Develop a concise, cohesive recovery approach, that future proofs your organization's security posture.

Key Deliverables

- **Remote Access Solution Vulnerability Assessment** – to ensure you have a robust remote access security model;
- **Phishing Simulation** – our team can target individuals or the wider organization through initial reconnaissance to provide a real-world demonstration of how attackers can obtain data. This simulation will also provide insight into how staff handle the incident response process;
- **Security Posture Assessment** – enabling you to gain a clear insight into your organization’s new security posture, formulate a strategy, and highlight any potential areas of concern;
- **Best Practice Home Working Guide** – designed by our expert risk advisory consultants to ensure risks are not introduced when adopting a remote working strategy; and
- **Remote Working Security Checklist** – to support technical and senior stakeholders with managing security control requirements that specifically relate to remote working.

“SureCloud has helped us to take a truly proactive and dynamic approach to cybersecurity and risk management, and deliver genuine peace of mind for our stakeholders.”

Justin Young, Director of Security and Compliance at Advanced
